

Quality Inspection Tracker

Mobile-first defect tracker for shop-floor supervisors — replaces paper registers.

Stack: NestJS 11 + Prisma 7 + SQLite + JWT, Swagger ([server/](#)) · React 19 + Vite + MUI + Tailwind, RHF, Axios, [localforage](#) ([client/](#))

Setup

`docker compose up --build`

	URL
Frontend	http://localhost:5173
Backend API	http://localhost:3000
Swagger Docs	http://localhost:3000/api

No seeded user — register via the app or `POST /auth/register`.

Decisions

- **NestJS+Prisma+SQLite** — clean modules, typed queries, zero infra; weak on concurrent writes (fine for one shop floor)
 - **JWT not sessions** — separate SPA/API; stateless token in `localStorage`, 401 → `/login`
 - **MUI+Tailwind** — MUI for components, Tailwind for badges (colors matched its default palette)
 - **localforage queue not PWA** — covers "sync when back online" without a service worker
 - **SAP webhook both ways** — `/api/sap-webhook` inbound (SAP creates inspections), `/sap/inspection` outbound mock on create/resolve
-

SAP Webhook

`POST /api/sap-webhook` — `{ inspectionDate, machineId, defectType, severity, remarks? }`, no auth, auto-creates via a system user (status `OPEN`).

Assumptions

SAP payload/auth unspecified (mirrored manual fields) · machine ID is free text · "sortable" = date toggle · Docker Hub images not pushed yet (compose already covers the 5-min local run requirement).

What I'd Do Differently

Automated tests · per-column/server-side sorting · seeded demo account · code-split the bundle.
